

Major Energy Company

Challenge

This major energy company inherited a set of Hyperion applications as part of the spin-off from Williams several years ago. They engaged US-Analytics to implement Enterprise Planning in the Cloud.

Solution / Results

The project was broken into two distinct sets of activities: a) well economics model and b) migration to EPBCS from on-prem Planning.

Besides successfully migrating their Planning application to the Cloud, we also created a scenario planning and modeling solution utilizing Oracle's Hyperion EPBCS application that went down to the field level. This was an automated process that allowed them ability to forecast instantly for multiple years into the future based upon multiple "Dials/Variables".
